## PROJECT DESCRIPTION

Aviation is one of transportation that essentially connects countries, people, and goods. Today, with the growing diversity and multiculturalism, a vast population takes flights from airports around the world. In correlation with these numbers, more airlines are emerging, and the business potential in this field is significant. Understanding people's movements and trends can be crucial for developing businesses across various fields. However, with the massive amount of data, it is challenging to manage this information in a structured format that facilitates multiple connections between categories.

Our project aims to address this issue by creating a comprehensive database, the Global Flight Network Database (GFND), to meet the varied needs of many stakeholders in the aviation sector and beyond. Our primary target is "Tourism Boards and Destination Marketing Organizations (DMOs)," and our goal is to enable these entities to leverage data from the worldwide travel and tourism industry to improve customer experiences, drive strategic decision-making, and stimulate innovation. This database can serve as a valuable tool for identifying popular locations, understanding travel trends, and creating targeted marketing campaigns for various stakeholders, such as travel agents, restaurants, and shops at airports. By analyzing passenger demographics, booking patterns, and airline routes, Tourism Boards and DMOs can tailor their marketing strategies to target travelers from specific areas or demographic groups. For example, insights from the Flight Network Database could inform decisions about offering food options at airports that align with the preferences of key visitor demographics, enhancing the overall tourism experience and increasing visitor engagement.

Similarly, the database can be utilized by groups such as business analysts, market research firms, and researchers and academics interested in exploring aspects of tourism, transportation, the economy, and environmental implications.

In conclusion, the primary goal of this project is to benefit Tourism Boards and Destination Marketing Organizations through the Global Flight Network Database. Additionally, it offers extensive data and analytics capabilities that enable stakeholders to explore new opportunities, foster innovation, and make informed decisions that improve the overall travelers' experience and support the sustainable growth of the aviation sector.

## OBJECTIVES

1. **Centralized Data Management:** GFND collects, updates, and maintains datasets from many sources, including outside vendors, airports, and airlines. These datasets include a wealth of data, including aircraft schedules, passenger demographics, and operational statistics, to provide stakeholders with a comprehensive picture of the aviation industry.
2. **Inventory Management:** Within the aviation network, GFND keeps track of the whereabouts and availability of aircraft, routes, and other resources. This makes it possible for all parties involved to guarantee seamless operations, optimize flight schedules, and manage resources effectively.

3. **Out-of-Stock Notification:** GFND promptly detects possible flight schedule interruptions, including aircraft maintenance or route closures, and notifies the appropriate parties to give resolution priority and reduce inconvenience to passengers.
4. **Demand Forecasting:** GFND uses past data and industry trends to project future demand for flights, routes, and services. This makes it possible for airports and airlines to plan capacity increases, allocate resources optimally, and effectively adapt to changing customer needs.
5. **Space Utilisation Optimisation:** To optimize flight schedules, maximize aircraft occupancy, and make effective use of airport infrastructure, GFND identifies popular routes, peak travel seasons, and growing travel patterns.
6. **Personnel Management:** To guarantee appropriate staffing levels, maximize workforce efficiency, and uphold high standards of service quality and safety, GFND manages personnel information, work schedules, and training requirements.
7. **Customer relationship management:** To improve customer happiness, loyalty, and retention, GFND finds a profile of devoted customers, examines their preferences and behaviors, and arranges tailored services and focused marketing initiatives.
8. **Real-time Updates and Tracking:** GFND minimizes disruptions and enables airlines, airports, and travelers to respond swiftly to changing circumstances by providing them with real-time updates on flight status, delays, cancellations, and other relevant information.
9. **Maintenance and Monitoring of Aviation Equipment:** GFND monitors the state of aircraft, airport infrastructure, and other aviation network-connected equipment to guarantee safe and dependable operations. This allows it to schedule maintenance, cut down on downtime, and arrange repairs.

## SCOPE

- Centralized source for all the data related to the aviation sector.
- Combining several datasets from airports, airlines, and outside sources.
- Information in real-time on operational events, route modifications, and flight schedules.
- Ongoing data upkeep to guarantee completeness and correctness.
- Advanced analytics enable a thorough examination of industry trends and travel trends.
- Service personalization and marketing initiatives based on client segmentation.
- Workforce management, capacity planning, and resource allocation optimization.
- Encouraging cooperation and information sharing amongst industry participants.
- Scalability to meet changing business needs and increasing data volumes.
- Adaptability to novel data sources, analytical methods, and technologies.
- Support for industry standards and compliance with regulations.

- Improvement of corporate performance, customer happiness, and operational efficiency.

## **PROJECT REQUIREMENTS**

- Operating System: Windows
- Database: MySQL
- Applications: MYSQL Workbench, draw.io, MS Word

## **DATABASE REQUIREMENTS**

We created the following tables in our databases to conduct analytics on the global flight network.

1. PASSENGER Table
2. FLIGHT Table
3. BOOKING Table
4. PAYMENT Table
5. AIRPORT Table
6. AIRPLANE Table
7. AIRLINE Table
8. AIRLINE\_AIRPLANE Table (Bridge table between AIRLINE and AIRPLANE Table)

## **USER REQUIREMENTS**

- The database will automatically create a unique passenger record for every single passenger, which tourism boards can use to track traveler preferences and history.
- Generate a unique booking ID for each reservation made through tourism board channels, enabling precise tracking and management of travel itineraries.
- Provide a self-service portal for travelers to update their personal information, ensuring that the tourism boards have access to the most current data for communication and logistics.
- Allow travelers associated with tourism boards to access detailed information on their bookings, including flight details, through a user-friendly interface.
- Generate automated reports that give tourism boards insight into daily travel activities, which can be used for resource allocation and strategic planning.
- Produce comprehensive operational reports including detailed passenger information, to assist tourism boards in managing group travels and events.
- Enable tourism boards to manage group bookings, including monitoring seat availability and managing waitlists or overbookings.
- Allow tourism boards to access location-based data within airports to improve traveler guidance and manage logistics for tours and group travels.
- Keep tourism boards updated with real-time flight statuses so they can communicate timely information to travelers and manage any necessary adjustments to travel plans.

- Allow data analysts working for tourism boards to analyze travel patterns, popular destinations, and customer feedback to shape marketing and development strategies.
- The database should support multi-language functionality and currency conversion to serve international travelers coordinated by tourism boards.

## **BUSINESS RULES**

1. All flights must have a unique identifier (flight number or code).
2. Departure and arrival airports for each flight must be valid and recognized airports in the database.
3. Aircraft assigned to flights must be available and compatible with the route.
4. Flight schedules must not overlap for the same aircraft.
5. Passenger and crew manifests must be accurate and match flight details.
6. Flights cannot be scheduled during maintenance periods for airports or aircraft.
7. Passengers must provide valid identification and travel documents for booking.
8. Ticket prices must adhere to predefined fare structures.
9. Seats must not be overbooked beyond the aircraft's capacity.
10. Tickets must be issued within a certain time frame before the flight departure.
11. Modifications to bookings (such as changes in dates, seats, or cancellations) must adhere to predefined policies and deadlines.
12. Passenger and crew background checks must be conducted before boarding.
13. Payments for tickets must be processed securely and in compliance with financial regulations.
14. Revenue recognition must follow accounting standards, considering factors like ticket sales, ancillary services, and refunds.
15. Exchange rates for international transactions must be up-to-date and accurate.
16. Flights must comply with international aviation regulations and agreements.
17. Flight routes and operations must adhere to airspace regulations and restrictions.
18. Aircraft maintenance must comply with regulatory maintenance schedules and standards.
19. Flights must be scheduled with adequate turnaround time between arrivals and departures.
20. Weather conditions and air traffic control restrictions must be considered when scheduling flights.
21. Effective communication protocols must be established between air traffic control, airports, and aircraft.
22. Passengers must be informed promptly of any changes to their flight schedule or disruptions.

# ENTITY RELATIONSHIP DIAGRAM (ERD)

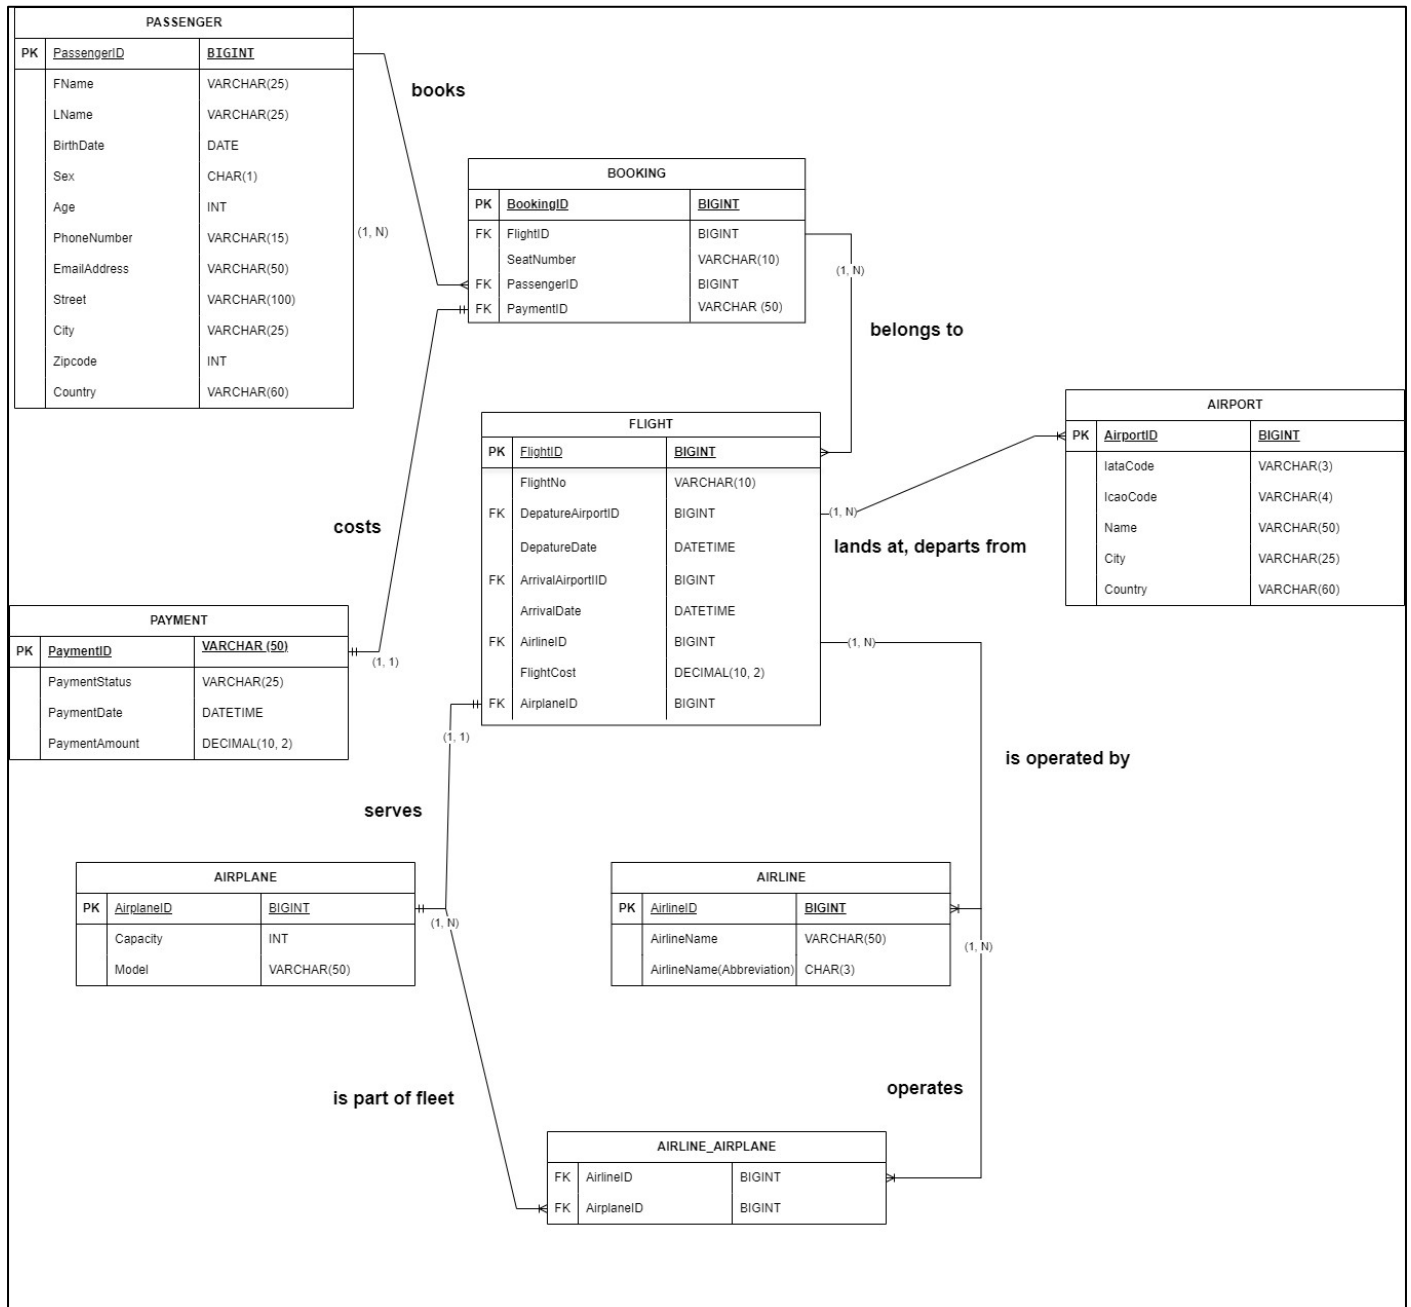

Table 1: Components of the ERM

Entity	Relationship	Connectivity	Entity
PASSENGER	Books	1:M	BOOKING
PAYMENT	Costs	1:1	BOOKING
BOOKING	Belongs to	1:M	FLIGHT
FLIGHT	Lands at, Departs from	1:M	AIRPORT
FLIGHT	Is operated by	1:M	AIRLINE

FLIGHT	Serves	1:1	AIRPLANE
AIRPLANE	Is part of fleet	1:M	AIRLINE_AIRPLANE
AIRLINE	Operates	1:M	AIRLINE_AIRPLANE

Note: The AIRLINE\_AIRPLANE table is the bridge table between the AIRPLANE table and the AIRLINE table to convert the M: N Relationship into two 1: M Relationships.

## DATA DICTIONARY

For any kind of data management system, the “data dictionary” is the most important component that helps the users to gain easy access to the entity table attributes and find their data types and keys (primary or foreign). The following are some of the key features of a data dictionary:

1. Helps in providing detailed information regarding attributes like description, data type, format, range, and others.
2. Assures data consistency by providing validation rules.
3. It also enhances data governance by providing transparency in data and by facilitating regulatory compliance.

Table 2: Data Dictionary

SNO.	Table Name	Attribute Name	Description	Type	Format	Range	Required	PK or FK	FK Reference Table
1	PASSENGERS	PassengerID	Identification number of the passenger	BIGINT	999999999 9999	-2 <sup>63</sup> to 2 <sup>63</sup>	Y	PK	
		FName	First name of the passenger	VARCHAR (25)	Xxxx		Y		
		LName	Last name of the passenger	VARCHAR (25)	Xxxx		Y		
		BirthDate	Date of birth of the passenger	DATE	MM/DD/YYYY		Y		
		Sex	Gender of the passenger	CHAR (1)	F/M		Y		
		Age	Age of the passenger	INT	13	0-150	N		
		PhoneNumber	Phone number of the passenger	VARCHAR (15)	xxxxxxxxx		Y		

		EmailAddress	Email address of the passenger	VARCHAR (50)	Xxx1x@		Y		
		Street	Street name of the passenger	VARCHAR (100)	xxxxxx		N		
		City	City name of the passenger	VARCHAR (25)	Xxxx		Y		
		ZipCode	Postal code of the passenger's address	INT	99999		Y		
		Country	Name of the passenger's country	VARCHAR (60)	Xxxxx		Y		
2	BOOKING	BookingID	Identification number of flight booking	BIGINT	999999999 9999	-2^63 to 2^63	Y	PK	
		FlightID	Identification number of flight	BIGINT	999999999 9999	-2^63 to 2^63	Y	FK1	FLIGHT
		SeatNumber	Allocated seat number in flight	VARCHAR (10)	A32		Y		
		PassengerID	Identification number of the passenger	BIGINT	999999999 9999	-2^63 to 2^63	Y	FK2	PASSENGERS
		PaymentID	Identification number for the payment made	VARCHAR (50)	999999999 9999	-2^63 to 2^63	Y	FK3	PAYMENT
3	FLIGHT	FlightID	Identification number of flight	BIGINT	999999999 9999	-2^63 to 2^63	Y	PK	
		FlightNo	Number allocated to the flight	VARCHAR (10)	Xxxx2		Y		
		Departure AirportID	Identification number of the Departure's Airport	BIGINT	999999999 9999	-2^63 to 2^63	Y	FK1	AIRPORT
		Departure Date	Date of Departure	DATETIME	YYYY-MM-DD HH:MI:SS		Y		
		ArrivalAirport ID	Identification number of the Arrival's Airport	BIGINT	999999999 9999	-2^63 to 2^63	Y	FK2	AIRPORT
		ArrivalDate	Date of Arrival	DATETIME	YYYY-MM-DD HH:MI:SS		Y		
		AirlineID	Identification Number of Airline	BIGINT	999999999 9999	-2^63 to 2^63	Y	FK3	AIRLINE

		Flightcost	Cost of the flight	DECIMAL (10,2)	999.11	0.1- 99999999 9.99	Y		
		AirplaneID	Identification Number of Airplane	BIGINT	999999999 9999	-2^63 to 2^63	Y	FK4	AIRPLANE
4	PAYMENT	PaymentID	Identification number for the payment made	VARCHAR (50)	999999999 9999	-2^63 to 2^63	Y	PK	
		Payment Status	Status of the payment	VARCHAR (25)	Xxx		Y		
		PaymentDate	Date of payment	DATETIME	YYYY- MM-DD HH:MI:SS		Y		
		Payment Amount	Total payment amount	DECIMAL (10,2)	999.11	0.1- 99999999 9.99	Y		
5	AIRPORT	AirportID	Identification Number of Airport	BIGINT	999999999 9999	-2^63 to 2^63	Y	PK	
		IATACode	IATA code allocated for the airport	VARCHAR (3)	Xxx		Y		
		ICAOCode	IATA code allocated for the airport	VARCHAR (4)	Xxx		Y		
		Name	Name of the airport	VARCHAR (50)	Xxxxx		Y		
		City	City where Airport is located	VARCHAR (25)	Xxxx		Y		
		Country	Country where Airport is located	VARCHAR (60)	Xxxxxx		Y		
6	AIRLINE	AirlineID	Identification Number of Airline	BIGINT	999999999 9999	-2^63 to 2^63	Y	PK	
		AirlineName	Name of the Airline	VARCHAR (50)	Xxxxx		Y		
		Abbreviation	Abbreviation of the Airlines	CHAR (3)	XXX		Y		
7	AIRPLANE	AirplaneID	Identification Number of Airplane	BIGINT	999999999 9999	-2^63 to 2^63	Y	PK	
		Capacity	Bearable load of the plane	INT	9999		Y		

		Model	Model of the airplane	VARCHAR (50)	Xxx9		Y		
8	AIRLINE_AIRPLANE	AirlineID	Identification Number of Airline	BIGINT	999999999 9999	-2^63 to 2^63	Y	FK1	AIRLINE
		AirplaneID	Identification Number of Airplane	BIGINT	999999999 9999	-2^63 to 2^63	Y	FK2	AIRPLANE

## QUERIES AND OPERATIONS

### 1. ENTITY GENERATION AND DATA ENTRY

#### Overview:

Our warehouse data model consists of two databases: FlightScheduling and CustomerService. Table 3 shows what tables are in each database, their descriptions, and the number of records. The database is split according to each table's subject and purpose. In Table 4, we listed the corresponding SQL queries for each task and their examples, which we used.

Table 3: DATABASE SCHEMA

Database	Table Name	Table Description	# of Records
FlightScheduling	AIRPORT	This table provides information about the airport: name, location, and IATA/ICAO codes.	8
FlightScheduling	AIRPLANE	This table provides information about the airplane's model and capacity.	8
FlightScheduling	AIRLINE	This table lists airline company data: name (full form and abbreviation form) and which country they are based in.	8
FlightScheduling	AIRLINE_AIRPLANE	This table is a joint table for airline and airplane tables. It doesn't have the primary key.	8
CustomerService	PASSENGER	This table provides the customer biographic information: name, gender, age, where they live, and contact.	50
FlightScheduling	FLIGHT	This table provides all the information about the flight: when departed/arrived, where, which airline operated, the airplane used, and so on.	50
CustomerService	PAYMENT	This table provides information about payment: the status, when the payment was made, and the price. It's also connected to customer data with a key.	50
CustomerService	BOOKING	This table provides the booking information. It has access to customer, flight, and payment data by foreign keys.	50

Table 4: Query Steps and Explanations

Steps	Query	Example
Create Database	CREATE DATABASE DBname;	Create DATABASE flightscheduling;

Create Table	USE DatabaseName; CREATE TABLE table_name ( column1 datatype, column2 datatype, column3 datatype, .... );	Use flightscheduling; CREATE TABLE `airport` ( `AirportID` BIGINT, `IATACode` VARCHAR(3), `ICAOCode` VARCHAR(4), `Name` VARCHAR(50), `City` VARCHAR(25), `Country` VARCHAR(25), PRIMARY KEY (`AirportID`));
Insert data into tables	INSERT INTO DatabaseName .table_name (column1, column2, column3, ...) VALUES (value1, value2, value3, ...);	INSERT INTO flightscheduling.airport (AirportID, IataCode, IcaoCode, Name, City, Country) VALUES (1, 'LAX', 'KLAX', 'Los Angeles International Airport', 'Los Angeles', 'United States');
Extract all data from tables	Select * from DatabaseName .table_name;	Select * from flightscheduling.airport;

As Table 4 shows, we used multiple SQL queries to create and manage our databases and tables. We ran the queries for all tables, and after the tables were created with all the data needed, we also ran the query to display all rows stored in tables. The queries and results of extracting all rows are the following:

/\* -----Create Databases-----\*/

Create DATABASE FlightScheduling;

Create DATABASE CustomerService;

/\* -----Create AIRPORT Table-----

\*/

Use FlightScheduling;

```
CREATE TABLE `AIRPORT` (  
    `AirportID` BIGINT,  
    `IATACode` VARCHAR(3),  
    `ICAOCode` VARCHAR(4),  
    `Name` VARCHAR(50),  
    `City` VARCHAR(25),  
    `Country` VARCHAR(60),  
    PRIMARY KEY (`AirportID`));
```

```
INSERT INTO flightscheduling.airport (AirportID, IataCode, IcaoCode, Name, City, Country) VALUES (1,  
'LAX', 'KLAX', 'Los Angeles International Airport', 'Los Angeles', 'United States');
```

```
INSERT INTO flightscheduling.airport (AirportID, IataCode, IcaoCode, Name, City, Country) VALUES (2,  
'JFK', 'KJFK', 'John F. Kennedy International Airport', 'New York', 'United States');
```

```
INSERT INTO flightscheduling.airport (AirportID, IataCode, IcaoCode, Name, City, Country) VALUES (3,  
'LHR', 'EGLL', 'Heathrow Airport', 'London', 'United Kingdom');
```

```
INSERT INTO flightscheduling.airport (AirportID, IataCode, IcaoCode, Name, City, Country) VALUES (4,  
'HND', 'RJTT', 'Tokyo Haneda Airport', 'Tokyo', 'Japan');
```

```
INSERT INTO flightscheduling.airport (AirportID, IataCode, IcaoCode, Name, City, Country) VALUES (5,  
'DXB', 'OMDB', 'Dubai International Airport', 'Dubai', 'United Arab Emirates');
```

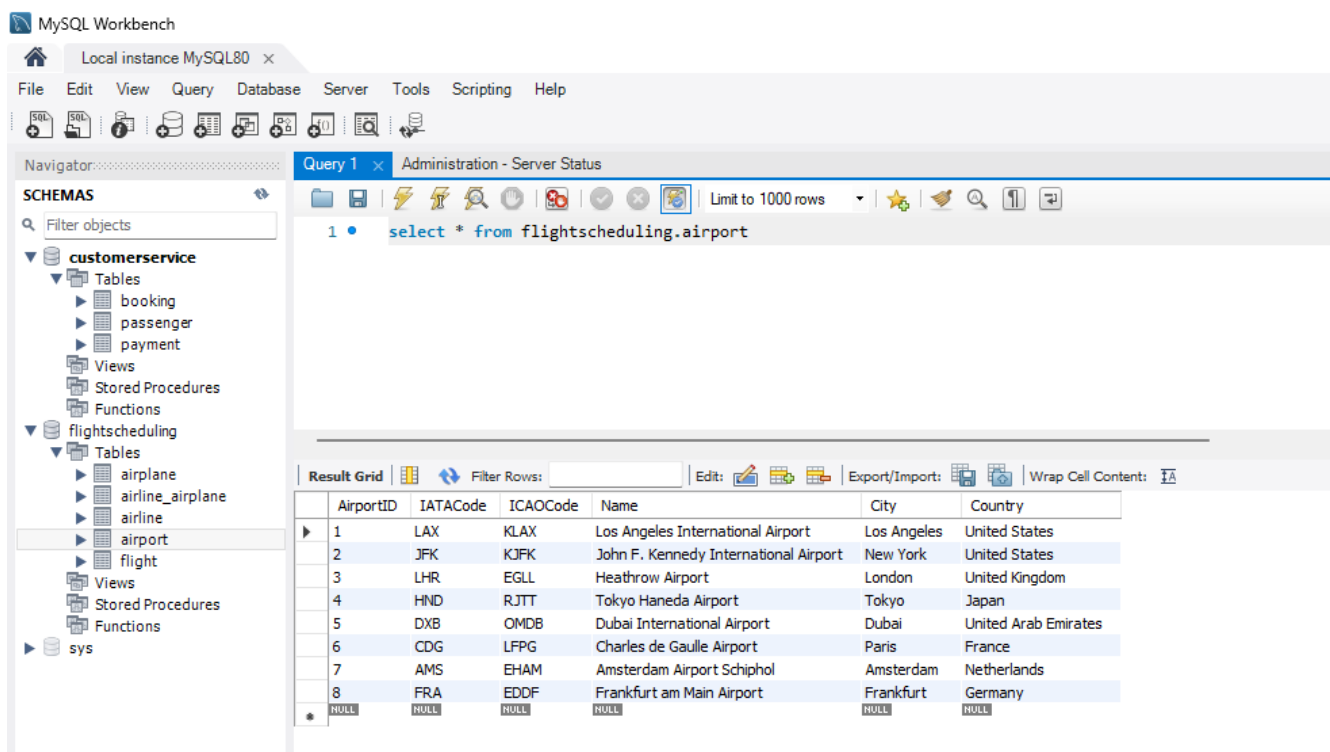

```

INSERT INTO flightscheduling.airport (AirportID, IataCode, IcaoCode, Name, City, Country) VALUES (6, 'CDG', 'LFPG', 'Charles de Gaulle Airport', 'Paris', 'France');
INSERT INTO flightscheduling.airport (AirportID, IataCode, IcaoCode, Name, City, Country) VALUES (7, 'AMS', 'EHAM', 'Amsterdam Airport Schiphol', 'Amsterdam', 'Netherlands');
INSERT INTO flightscheduling.airport (AirportID, IataCode, IcaoCode, Name, City, Country) VALUES (8, 'FRA', 'EDDF', 'Frankfurt am Main Airport', 'Frankfurt', 'Germany');

```

### Table Explanation:

This table provides information about the airport: name, location, and IATA/ICAO codes. It helps us identify airports in flight scheduling and route planning. Having special codes, such as IATA/ICAO codes is especially useful for aviation systems since they're common identification around the world and easier to manage data in software, booking systems, and itineraries.

The screenshot shows the MySQL Workbench interface. On the left, the 'SCHEMAS' pane shows the 'flightscheduling' database selected. The 'airports' table is highlighted under the 'Tables' folder. The main window displays the 'Query 1' tab with the SQL query 'select \* from flightscheduling.airport'. Below the query, the 'Result Grid' shows the data for the 'airports' table.

AirportID	IATACode	ICAOCode	Name	City	Country
1	LAX	KLAX	Los Angeles International Airport	Los Angeles	United States
2	JFK	KJFK	John F. Kennedy International Airport	New York	United States
3	LHR	EGLL	Heathrow Airport	London	United Kingdom
4	HND	RJTT	Tokyo Haneda Airport	Tokyo	Japan
5	DXB	OMDB	Dubai International Airport	Dubai	United Arab Emirates
6	CDG	LFPG	Charles de Gaulle Airport	Paris	France
7	AMS	EHAM	Amsterdam Airport Schiphol	Amsterdam	Netherlands
8	FRA	EDDF	Frankfurt am Main Airport	Frankfurt	Germany
NULL	NULL	NULL	NULL	NULL	NULL

/\* -----Create AIRPLANE Table----- \*/

Use FlightScheduling;

```

CREATE TABLE `AIRPLANE` (
  `AirplaneID` BIGINT,
  `Capacity` INT,
  `Model` VARCHAR(50),
  PRIMARY KEY (`AirplaneID`));

```

```

INSERT INTO flightscheduling.airplane (AirplaneID, Capacity, Model) VALUES (1, 160, 'Airbus A320');
INSERT INTO flightscheduling.airplane (AirplaneID, Capacity, Model) VALUES (2, 150, 'Boeing 737-800');
INSERT INTO flightscheduling.airplane (AirplaneID, Capacity, Model) VALUES (3, 366, 'Boeing 777-300');
INSERT INTO flightscheduling.airplane (AirplaneID, Capacity, Model) VALUES (4, 242, 'Boeing 787-8');

```

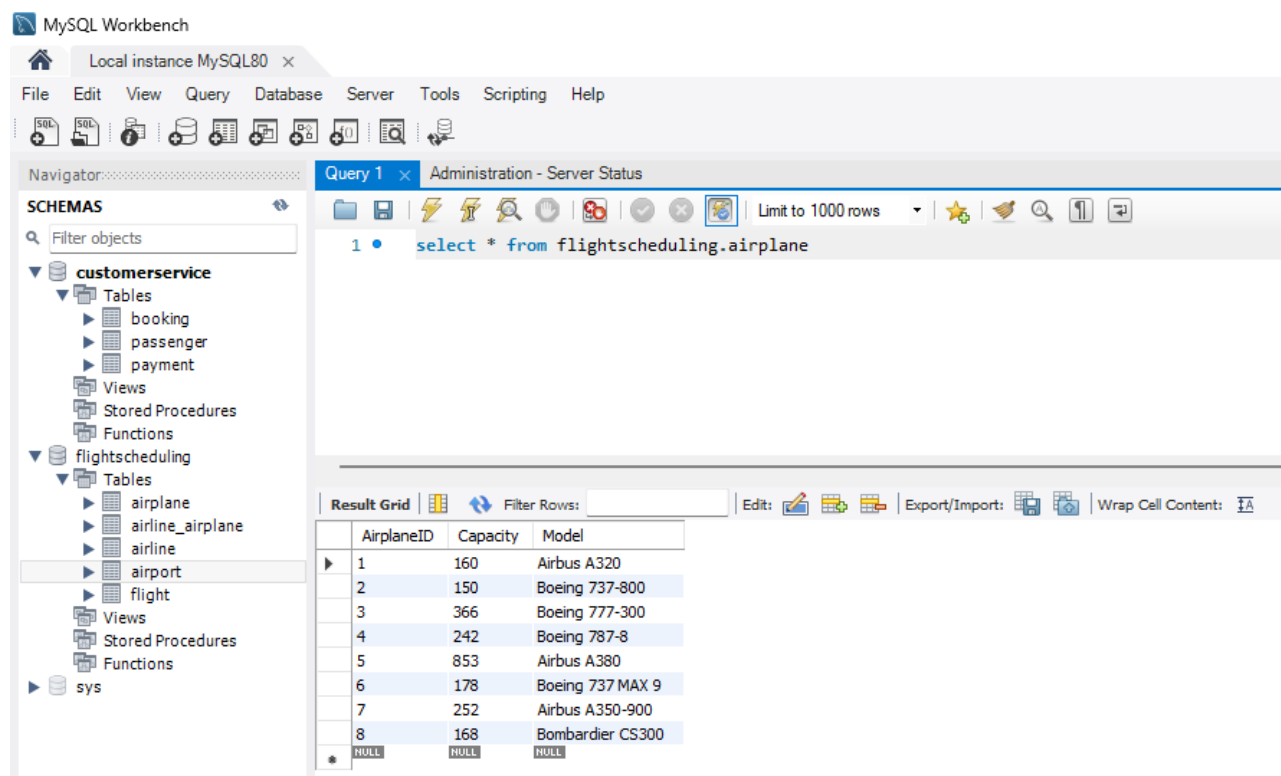

```

INSERT INTO flightscheduling.airplane (AirplaneID, Capacity, Model) VALUES (5, 853, 'Airbus A380');
INSERT INTO flightscheduling.airplane (AirplaneID, Capacity, Model) VALUES (6, 178, 'Boeing 737
MAX 9');
INSERT INTO flightscheduling.airplane (AirplaneID, Capacity, Model) VALUES (7, 252, 'Airbus A350-
900');
INSERT INTO flightscheduling.airplane (AirplaneID, Capacity, Model) VALUES (8, 168, 'Bombardier
CS300');

```

### Table Explanation:

This table provides information about the airplane's model and capacity. It helps in managing the flight schedules based on airplane availability, seating capacity, and other special features of each model of airplane.

/\* -----Create AIRLINE Table----- \*/

Use FlightScheduling:

```

CREATE TABLE `AIRLINE` (
  `AirlineID` BIGINT,
  `AirlineName` VARCHAR(50),
  `Abbreviation` CHAR(3),
  PRIMARY KEY (`AirlineID`));

```

```

INSERT INTO flightscheduling.airline (AirlineID, AirlineName, AirlineNameAbbreviation) VALUES (1,
'American Airlines', 'AA');

```

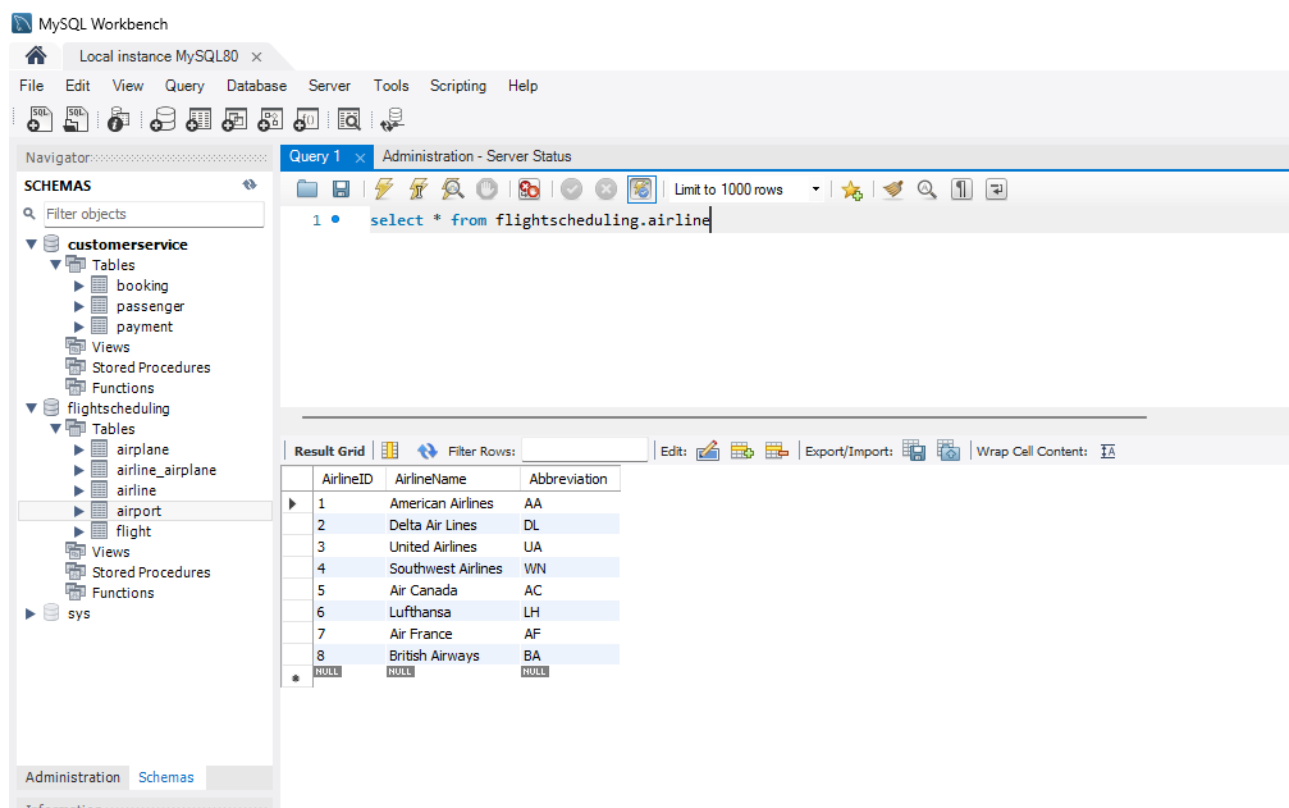

```

INSERT INTO flightscheduling.airline (AirlineID, AirlineName, AirlineNameAbbreviation) VALUES (2,
'Delta Air Lines', 'DL');
INSERT INTO flightscheduling.airline (AirlineID, AirlineName, AirlineNameAbbreviation) VALUES (3,
'United Airlines', 'UA');
INSERT INTO flightscheduling.airline (AirlineID, AirlineName, AirlineNameAbbreviation) VALUES (4,
'Southwest Airlines', 'WN');
INSERT INTO flightscheduling.airline (AirlineID, AirlineName, AirlineNameAbbreviation) VALUES (5,
'Air Canada', 'AC');
INSERT INTO flightscheduling.airline (AirlineID, AirlineName, AirlineNameAbbreviation) VALUES (6,
'Lufthansa', 'LH');
INSERT INTO flightscheduling.airline (AirlineID, AirlineName, AirlineNameAbbreviation) VALUES (7,
'Air France', 'AF');
INSERT INTO flightscheduling.airline (AirlineID, AirlineName, AirlineNameAbbreviation) VALUES (8,
'British Airways', 'BA');

```

### Table Explanation:

This table lists airline company data: name (full form and abbreviation form) and which country they are based in. It helps us to manage the relationships between flights/flights and flights/airlines. Airlines belong to each alliance and have partnerships between them. This is related to code-sharing agreements.

/\* -----Create PASSENGER Table----- \*/

```

Use CustomerService;
CREATE TABLE `PASSENGER` (
  `PassengerID` BIGINT,

```

```

`FName` VARCHAR(25),
`LName` VARCHAR(25),

## Table Explanation:

This table provides all the information about flights: departure and arrival times, locations, operating airlines, and aircraft used, among other details. Tracking flight information assists in flight scheduling, providing real-time status updates to passengers, crew scheduling, and managing air traffic. Additionally, in the event of emergencies, it is also useful for risk management.

The screenshot shows the MySQL Workbench interface. The left sidebar displays the 'SCHEMAS' tree with 'customerservice' and 'flightscheduling' expanded. The 'flightscheduling' schema contains tables 'airplane', 'airline', 'airport', and 'flight'. The 'flight' table is selected. The main window shows a query: `select * from flightscheduling.flight`. The 'Result Grid' displays the following data:

FlightID	FlightNo	DepartureAirportID	DepartureDate	ArrivalAirportID	ArrivalDate	AirlineID	Flightcost	AirplaneID
1031	Gc0312	1	2022-01-09 00:09:00	8	2022-01-09 05:55:00	3	442.60	2

### Table Explanation:

This table provides information about payment: the status, when the payment was made, and the price. It's also connected to customer data with a key and is useful to analyze customer spending patterns from the payment date and status.

PaymentID	PaymentStatus	PaymentDate	PaymentAmount
81d920b8-f324-4e00-bca2-b0e6877d43ba	Pending	2021-04-21 22:59:00	456.07

### Table Explanation:

This table provides the booking information. It has access to customer, flight, and payment data by foreign keys. As the main table in our databases, it enables us to have access to any tables through this.

The screenshot shows the MySQL Workbench interface. On the left, the 'SCHEMAS' pane displays the 'customerservice' database structure, including tables like 'booking', 'passenger', 'payment', 'airplane', 'airline', 'airport', and 'flight'. The main window shows a query result grid for the query 'select \* from customerservice.booking'. The grid contains 16 rows of data with columns: BookingID, FlightID, SeatNumber, PassengerID, and PaymentID.

BookingID	FlightID	SeatNumber	PassengerID	PaymentID
1	8796	77c	14	e1ec67d6-48d8-4168-8e0c-e5b4490bdabb

## 2. DATA RETRIEVAL AND ANALYTICAL REPORTS

### Overview:

Using the data from tables, we can create subsets based on various combinations of columns. These subsets can be utilized for detailed analysis in several fields, such as developing marketing strategies for airport restaurants, enhancing airport operations, and making effective business decisions for travel packages, among others.

In our project, we created five subsets by executing five distinct SQL queries and derived analytical insights for each, accompanied by screenshots of the query results. While working on subsets, we set short-form table names using aliases. The following table shows short names for each table.

Table 5: Short Table Name List

Table Name	Short Name
AIRPORT(for departure and arrival)	dept_airport, arr_airport
AIRPLANE	ap
AIRLINE	a
AIRLINE_AIRPLANE	aa
PASSENGER	p
FLIGHT	f
PAYMENT	pay
BOOKING	b

- Data Analytics 1

**Statement:** Extracting biographic data of passengers with airports they used ordered by departure airport name and arrival airport name in descending.

**SQL command explanation:**

- SELECT DISTINCT extracts unique values.
- CONCAT(p.FName, ' ', p.LName) AS 'Passenger Name' combines the values in the two different columns, p.FName and p.LName, and store it into one field named 'Passenger Name' using an alias.
- The query begins from the customerservice.passenger table.
- It joins four tables, customerservice.passenger, customerservice.booking, flightscheduling.flight, and flightscheduling.airport, using JOIN and ON commands.
- To get the airport name in the two different columns, we wrote JOIN clauses twice and named them 'dept\_airport' and 'arr\_airport' using aliases.
- The results are ordered by the name of the departure airport and the arrival airport in ascending order. Priority comes first to the name of the departure airport in this case.

/\*----- Data Analytics 1 -----\*/

```

SELECT DISTINCT
    p.PassengerID,
    CONCAT(p.FName, ' ', p.LName) AS 'Passenger Name',
    p.BirthDate,
    p.Sex,
    p.Age,
    p.Country,
    dept_airport.Name AS 'Departure Airport Name',
    arr_airport.Name AS 'Arrival Airport Name'
FROM
    customerservice.passenger p

```

```

JOIN
    customerservice.booking b ON p.PassengerID = b.PassengerID
JOIN
    flightscheduling.flight f ON b.FlightID = f.FlightID
JOIN
    flightscheduling.airport dept_airport ON f.DepartureAirportID = dept_airport.AirportID
JOIN
    flightscheduling.airport arr_airport ON f.ArrivalAirportID = arr_airport.AirportID
ORDER BY
    dept_airport.Name, arr_airport.Name;
/*----- Results -----*/

```

Query 1

```

1 • SELECT DISTINCT
2     p.PassengerID,

	25	Tasha Burke	2003-02-13	F	21	Kiribati	Frankfurt am Main Airport	Charles de Gaulle Airport

- Data Analytics 2

**Statement:** Extracts the unique combinations of departure and arrival airports for passengers from each country with a calculated count, grouping and ordering the results by country, departure airport, and arrival airport in ascending order.

**SQL command explanation:**

- SELECT DISTINCT extracts unique values.
- From Data Analytics 1, we used the same columns, dept\_airport.Name AS 'Departure Airport Name', arr\_airport.Name AS 'Arrival Airport Name', again.
- COUNT(\*) AS 'Number of Combinations' counts the total number of combinations in each group. We can know the pattern of passenger routes for each country passengers are from.
- Table joining are same as Data Analytics 1.
- We grouped the results by country, departure airport, and arrival airport using the GROUP BY command for counting.

- The results are ordered by customerservice.passenger.Country, dept\_airport.Name, and arr\_airport.Name in ascending order, The priority goes to the country first, and departure airport, and the arrival airport.

/\*----- Data Analytics 2 -----\*/

```

SELECT DISTINCT
    p.Country,
    dept_airport.Name AS 'Departure Airport Name',
    arr_airport.Name AS 'Arrival Airport Name',
    COUNT(*) AS 'Number of Combinations'
FROM
    customerservice.passenger p
JOIN
    customerservice.booking b ON p.PassengerID = b.PassengerID
JOIN
    flightscheduling.flight f ON b.FlightID = f.FlightID
JOIN
    flightscheduling.airport dept_airport ON f.DepartureAirportID = dept_airport.AirportID
JOIN
    flightscheduling.airport arr_airport ON f.ArrivalAirportID = arr_airport.AirportID
GROUP BY
    p.Country,
    dept_airport.Name,
    arr_airport.Name
ORDER BY
    p.country ASC,
    dept_airport.Name ASC,
    arr_airport.Name ASC;

```

/\*----- Results -----\*/

	Antigua and Barbuda	Amsterdam Airport Schiphol	Frankfurt am Main Airport	2
	Bangladesh	Frankfurt am Main Airport	Dubai International Airport	1
	British Indian Ocean Territory (Chagos Archipel...	Heathrow Airport	Tokyo Haneda Airport	1
	British Indian Ocean Territory (Chagos Archipel...	Los Angeles International Airport	Charles de Gaulle Airport	1
	Cambodia	Dubai International Airport	Charles de Gaulle Airport	1
	Cambodia	Heathrow Airport	Amsterdam Airport Schiphol	1
	Cambodia	John F. Kennedy International Airport	Heathrow Airport	1

- Data Analytics 3

**Statement:** Extracts each passenger's first name, last name, email address, and the total number of their travel bookings, grouping the results by the passenger's full name and email address.

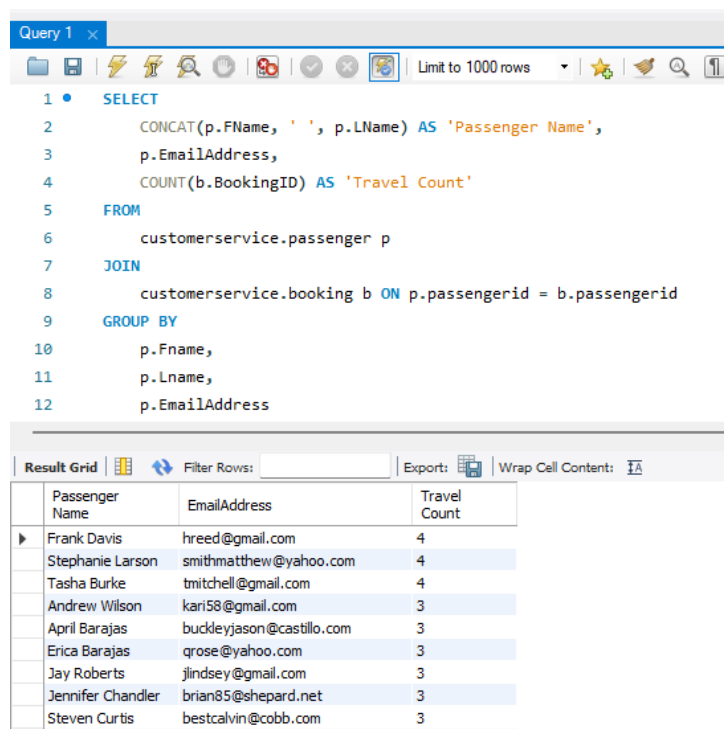

**SQL command explanation:**

- COUNT(b.BookingID) AS 'Travel Count' counts the total number of combinations in each group. We can know the pattern of passenger's route for each country passengers are from.
- This query joins two tables.
- We grouped the results by the first name, last name, and email address of the passengers for the COUNT command.
- The results are ordered by the 'Travel Count' in descending order first, which means from most to least, then 'Passenger Name' in alphabetical order.

/\*----- Data Analytics 3 -----\*/

```
SELECT
    CONCAT(p.FName, ' ', p.LName) AS 'Passenger Name',
    p.EmailAddress,
    COUNT(b.BookingID) AS 'Travel Count'
FROM
    customerservice.passenger p
JOIN
    customerservice.booking b ON p.passengerid = b.passengerid
GROUP BY
    p.Fname,
    p.Lname,
    p.EmailAddress
ORDER BY
    COUNT(b.BookingID) DESC,
    CONCAT(p.FName, ' ', p.LName);
```

/\*----- Results -----\*/

The screenshot shows a SQL query editor with a toolbar at the top. The query is displayed in a text area, and below it, the results are shown in a table. The table has three columns: Passenger Name, EmailAddress, and Travel Count. The results are ordered by Travel Count in descending order, with Frank Davis and Stephanie Larson having the highest count of 4.

Passenger Name	EmailAddress	Travel Count
Frank Davis	hreed@gmail.com	4
Stephanie Larson	smithmatthew@yahoo.com	4
Tasha Burke	tmitchell@gmail.com	4
Andrew Wilson	kari58@gmail.com	3
April Barajas	buckleyjason@castillo.com	3
Erica Barajas	grose@yahoo.com	3
Jay Roberts	jindsey@gmail.com	3
Jennifer Chandler	brian85@shepard.net	3
Steven Curtis	bestcalvin@cobb.com	3

- Data Analytics 4

**Statement:** Extracts detailed passenger and flight information about the selected airline companies in the selected year (period) before 2024.

**SQL command explanation:**

- In the WHERE clause, we can select a specific year (range) by using parameters (=, <, >, =<, =>) to fetch more detailed data.
- Similarly, we also can select specific airlines, and for example, we demonstrated whose names start with 'A' by using LIKE 'A%'.
- The results are ordered by the departure dates in ascending order, which is from the older to the latest dates.

```
